Abstract (en)

[origin: EP0285703A2] A connector with a case and a contact insertion piece, which can be inserted in the case, has an elastic snapping element, which engages in a circumferential slot arranged on the inside of the case when the contact insertion piece is inserted in the case. To prevent the contact insertion piece having play in the tipping sense with respect to the case, in the circumferential slot there is an axially movable intermediate ring, which can be pushed over the snapping element, the intermediate ring and the snapping element being designed such that the snapping element is displaced in the radial direction with respect to its original position when the intermediate ring is in the position pushed over the snapping element. <IMAGE>
