Abstract (en)
[origin: EP0286925A2] The device (1) for liquid, in particular foaming, media has a compressed air pump (3) to apply pressure to the medium container (2) and a medium channel which is controlled by a valve mechanically via the same actuating head (12) as the pump (3), which medium channel is formed by axial joining together of an outlet channel (22) and a feed channel (24). When these channels are joined together, valves (32, 33) belonging to the compressed air pump (3) are opened mechanically towards the end of the pump stroke, the medium channel penetrating the pump chamber (8) being essentially sealed off in this delivery position in relation to the pump chamber (8). Compressed air from the container (2) is added to the medium flow for foaming of the medium. <IMAGE>
