Abstract (en)

[origin: EP0287023A2] The production of such a sprayed surface on a workpiece is to be improved and a surface layer with a clearly defined roughness is to be provided, with relatively simple handling. For this purpose, a pulverulent material consisting of a mixture of a matrix of Ni, Co and/or Fe base alloy and sintered materials having a grain size distribution of the sintered materials with a maximum fraction between 25 and 150 μm is sprayed on, the sprayed unsintered layer having a surface roughness in the range of Ra from 10 to 100 μm with a defined roughness of Ra $x \times \pm 20 \mu\text{m}$, x being a number from 10 to 100 μm . The process of the invention is intended to be used for producing the surface of transport rollers or gripper fingers for paper or cardboard manufacture.
