Abstract (en)

[origin: EP0287049A2] The invention relates to a process for the settlement and collection of money in coin-operated automatic machines, in which the cash sums exceeding a fixed minimum coin reserve are conveyed away outside the automatic machines via a coin-flow switch. The coins coming out of each automatic machine are separated according to coin types and are counted. The count values are added in a machine cash counter and, in parallel, in the stock counter of a central cash or coin-type collecting container. The separated and counted coins are then either separated according to coin types and fed to a central coin-type collecting container or are fed to a central cash container.
