Abstract (en)

[origin: EP0287317A2] Complexes of platinum II containing a single radiosensitizer ligand and one or two amino or ammine substituents of the formula: [PtX<sub>2</sub>(NR<sub>2</sub>H)L] (1) or [PtX(NR<sub>2</sub>H)<sub>2</sub>L]<+>Y<-> (2) wherein X is a monovalent biologically acceptable anion, and in formula (1) both X together can also be a divalent biologically acceptable anion; Y<-> is a monovalent biologically acceptable anion; each R is independently H or alkyl, or both Rs together are a piperidino or morpholino residue; and L is a radiosensitizing ligand which is a mononitro-substituted aromatic moiety containing at least one heterocyclic N and/or substituent amine. The compounds show superior binding to DNA and are useful in chemotherapy and sensitization of hypoxic tumors to radiation. The chemotherapeutic value of these compounds is enhanced by administration of vasoactive agents.
