Abstract (en)

A handy, simple forked shell and membrane stripper capable of simultaneously stripping the shell and membrane of the boiled eggs consists of a stem portion (2) and a forked portion comprising a central fork (4) and two elongate side members (3), the central fork having a free end formed with a head (4'), the side members (3) straddling the central fork and having front ends remote from the stem portion which are bridged by a cross-piece to constitute a guide face (3') for guiding the central fork while sliding on the outer surface of the egg shell so that the central fork may creep under the membrane of the boiled egg.
