Abstract (en)  
[origin: EP0287752A2] In known electromagnetic switchgear, the electromagnetic instantaneous release operates either via an intermediate lever or via a pretensioned latching mechanism on the contact link support, as a result of which the instantaneous release is delayed, so that the required safety against contact welding is not achieved. The invention therefore relates to producing a particularly compact structural arrangement of the electromagnetic drive and instantaneous release of such electromagnetic switchgear which, on the one hand, ensures that the contacts are opened without delay when the instantaneous release is operated, it also being necessary, however, to move only small masses to open the contact link without operating the instantaneous release. This is achieved by the electromagnetic instantaneous release (3) acting directly and without delay, without an intermediate member, on the contact link carrier (8) in the event of a high overload current (short-circuit current) and opening the contacts. <IMAGE>
