Abstract (en)

[origin: EP0288799A2] The container, which is mounted on running rollers in a stacking cage and can be rotated about its longitudinal axis by a rotary drive or by hand, is constructed as a rotary body and equipped on the inside with a mechanical conveying and fluidising device. One of the container bottoms serves as emptying bottom and is combined with an emptying device which surrounds a passage, guided through a central opening in the emptying bottom, for the bulk product. The opposite container bottom serves as pressure compensation bottom and is combined with a pressure compensation device. <IMAGE>
