Abstract (en)
The invention relates to a refrigerated cabinet comprising at least three compartments (11,12,13) at different temperatures, two (11, 13) of which are cooled by two separate evaporators (21, 23), one for each compartment, connected to a single refrigerant circuit with a compressor (20) and condenser (25), and comprising a pressure reduction member (22) between the two evaporators. It is characterised in that the pressure reduction member (22) is a capillary tube, at least one part of which is in heat exchange with a third compartment (12) and constitutes the refrigerating member of said third compartment. <IMAGE>
