Abstract (en)
An intraocular lens implant comprising a flexible, substantially ring-shaped position fixation member (20) having a lens body (14) positioned centrally therein. The lens body is connected to the position fixation member by either rim portions (22, 24) or posts which have a notch formed therein for receiving one end of the incision through which the implant will be inserted. The notch permits the implant to be inserted in an incision shorter than the diameter of the implant. The method of implanting the implant is also described.
