Abstract (en)

The invention relates to a process for producing an end joint of a panel of a wall cast in the ground, in which a trench (1) is dug, a formwork (2a) is arranged at its end, the trench is concreted and the formwork is extracted. Before the concreting of the trench, the face of the formwork on the concrete side is covered with a thin material (9a) which can be left in the trench, and the formwork is extracted substantially vertically. <IMAGE>
