Abstract (en)

[origin: EP0290332A1] The process involves introducing into the machine a metering and diffusing device containing a quantity of particulate detergent corresponding substantially to one wash. This device is of the type comprising a body (2) and a cap (3) having holes (6). The particular feature of the device is the presence of a plate (7) having a hole (8) allowing the water to have access to the interior of the device, but preventing the massive and uncontrolled escape of the particulate detergent. The latter is thus predissolved, before being progressively released into the medium containing the laundry during the washing operation. <IMAGE>
