Abstract (en)
[origin: EP0290788A2] A loom has been provided with a device for the selected movement of pivotable feed-fingers between a rest position and an operating position. Each feed-finger is associated with a snap mechanism which, on passing through a dead point, snaps into the rest position or into the operating position. The feed-fingers can be entrained out of the rest or operating position by transfer means which contain switchable electromagnets. <IMAGE>
