Abstract (en)  
[origin: EP0290872A2] An electronic information display system serves, for example, for displaying information relating to a specific number of objects such as, for example, to rooms of a hotel. The system comprises an optical display which is controlled by a computer and an operating keyboard (25) as well as an information store randomly set by the computer. The optical display comprises a display panel (11) and for each individual object a separate display device (20) installed in the display panel. The keyboard (25) has a number of information overview or function keys (29) which on being actuated simultaneously cause a requested type of information to be displayed for all the objects. Provided spatially adjacent to each display device (20) there is an optical signalling device (22) individually functionally assigned to the respective display device (20) and having an associated switching panel (24) and which displays additional monitoring information relating to the object associated with the display device (20) assigned to it. <IMAGE>
