Abstract (en)

[origin: EP0291268A2] A dish mounting includes a base which is attached to a wall or other structure (11), a frame or chassis (13) which can be swung about a vertical axis relative to the base and a dish (10) appropriately carried by the frame or chassis. Releaseable clamping means are provided for securing the frame or chassis in a position in which the dish faces due south and the dish itself is pivotable relative to the frame or chassis about first and second spaced fixing points (14, 15). One of the fixing points is adjustable, by means of a screw-threaded rod (16), towards and away from the base and the other fixing point incorporates a hinge to allow the dish to move, in use, as the said one fixing point is moved towards and away from the base.
