Abstract (en)

[origin: EP0291370A1] 1. A monitoring device (10) for the pressure of the liquid delivered by a pump (38), comprising a receptacle (12) whose lower portion is formed with a pressurized liquid supply aperture (14) connected to the delivery side (44) of the pump, its upper portion having a level detector (18), characterized in that the pump (38) is kinematically connected to a vehicle wheel fitted with the pump and the device ; the device comprises a ball (28) forming a valve closure member which rests on the bottom of the receptacle (12) to close the supply aperture (14) when the delivery pressure is lower than a predetermined value ; and the ball (28) can be lifted off its valve seat by vibrations which are caused by the rolling of the vehicle and are transmitted to the receptacle (12), thus allowing the progressive discharge of the liquid in case of the pump (38) malfunctioning.
