Abstract (en)
[origin: EP0291811A2] In order to improve a slide for an insert, in particular a drawer, which can be pulled out of a frame, having a first slide rail, which can be mounted on the frame, a second slide rail, guided displaceably on the first slide rail and bearing the insert, and a catch element, which can be attached to the insert and has a catch member, for fixing the second slide rail on the insert in the pulling-out direction, in such a way that there is a rolling security device without the assembly of additional parts and that, in spite of this, the advantages of easily running slides are maintained, it is proposed that the catch element has at least one first rolling security member, and that a second rolling security member is provided which is fixed to the frame and is arranged in such a way that, in an inserted end position of the slide rails, the rolling security members rest against one another, forming a common contact surface and producing a rolling resistance acting in the pulling-out direction. <IMAGE>
