Abstract (en)

[origin: EP0291836A1] The pallet (1) comprises a pallet surface (2), receiving the loading goods, a pallet stand surface (base surface) (30, 40), and support elements (3, 4) which space said stand surfaces apart and between which at least one loading channel is arranged in at least one of the two main dimensions of the rectangle for engagement on loading bars of floor conveyors. In order to provide an inexpensive small pallet of this type which guarantees secure transportation with the aid of floor conveyors (lifting trucks, fork lift trucks) despite the reduced dimensions, the centre line (L) of the loading channel (5) is offset relative to the parallel centre line (M) of the pallet surface and, along the free edge of the half of the pallet surface facing away from the centre line of the channel, a lateral, free flange or web (6) is provided, under which a loading bar can grip from the stand surface and which extends beyond the lateral boundary (31) of the support element. <IMAGE>
