Abstract (en)

[origin: EP0292432A1] The device has a coupling pin (3) at the end of the drinking hose (2). A diaphragm part is retained in the coupling pin, the sealing effect of which diaphragm part can be cancelled by central pressure (A) from outside. The diaphragm part, however, also opens in the event of an overpressure exerted from inside, so that the drinking hose can be blown out after the drinking process has ended. The coupling pin (3) can be pressed into a connecting piece which is sealed with the aid of a valve lifter (10). In the pressed-in state, the valve lifter opens the diaphragm part, the valve lifter itself being pushed into the open position. <IMAGE>
