Abstract (en)

[origin: JPS6480693A] PURPOSE: To form the entirety of a device extremely flatly, and thereby enable it to be attached in a thin wall by introducing a pulling strap laterally piercing through a grip trough arranged in parallel with a strap winder drum on a base plate. CONSTITUTION: A grip trough 2 is disposed on a base plate 1 at the side of a drum 11 in a parallel therewith. Following this, a pulling strap 3 drawn out of a strap winder drum 11 is guided by guide rollers 10, 9, 8 so as to laterally pierce through the grip trough 2 via an openings 5, 4. In addition, the pulling strap 3 is guided in a manner that its belt face comes to be vertical with respect the rotation shaft of the strap winder drum 11 to then be passed through a strap tightening device 6 provided in the vicinity of one opening 4 of the grip trough 2. This can make the length of the pulling strap 3 sufficient with relatively short one, and also make a diameter of the strap winder drum 11 smaller than in usual.
