Abstract (en)

[origin: EP0292890A2] The arrangement comprises a link (10) which engages in the end face of a crossbar (56) and is fastened thereto and which is mounted on the outside of a frame bar (36) and is fastened thereto with a connection part (20), which traverses the frame bar (36) which consists of plastic and has a hollow profile, and acts on a profile wall (40) opposite the link (10), which wall is kept free from cross-sectional deformation by a reinforcement part built into the profile interior. In order to improve a joining arrangement in such a way that a strengthening of the frame bar (36) is produced only at the location of the connection part (20), the strengthening part is a supporting part (42) present only in the passage region of the connection part (20), and the profile wall (40) opposite the link (10) has a built-in opening (43) for the supporting part (42). <IMAGE>
