Abstract (en)

[origin: EP0292925A2] In the operating position, a dipping nozzle (3) is to rest against a sliding-plate mechanism (1) with a defined contact force. The risk of damage during assembly is to be reduced. The dipping nozzle (3) is supported via a supporting ring 9 and supporting parts 7 against transverse pieces (6) inserted through fastening bolts (4). Arranged between the supporting ring (9) and the supporting parts (7) is at least one spring assembly (10), which can be brought into a stressed and a relieved state by clamping means (13). In the relieved state of the spring assembly (10), there is a clearance (H) between the dipping nozzle (3) and a stop rim (21). In the relieved state, the spring assembly (10) presses the dipping nozzle (3) against the stop rim (21) via the supporting ring (9). <IMAGE>
