Abstract (en)  
[origin: EP0294361A2] The wooden door- or window-frame (1) comprises frame members (2) of identical cross-sectional shape, a protective rail (5) made of plastic and extending around along every frame member covering the rebate region of the frame members (2), which protective rail (5) interacts with a sealing strip (7) and can be drained to the outside by means of ducts of the lower frame member. In order to draw off water in a reliable manner and to achieve durable, frost-resistant sealing, the protective rail (5), which is laid in an adhesive and/or sealant bed (6) on the frame members (2), has an open channel profile and forms a sealing strip-free run-off for water, the inner channel wall serving as abutment (5a) for the sealing strip (7) associated with the wing frame (4) and drain tubes (8) which traverse the ducts of the lower frame member (2) being connected to the channel. <IMAGE>
