Abstract (en)
[origin: EP0294496A1] Arranged below a multi-chamber silo (10) is a vibrating conveyor trough (24) which is fed with aggregate from a silo chamber (12) and conveys the aggregate in a controlled flow into a collecting container (36). Via bellows (30), the discharge end of the trough (24) is attached in a leakproof manner to the collecting container (36), which at the same time is a weighing container and a mixing container. A tube (46) passes through the trough (24) and feeds cement from a chamber (14) into the collecting container (36). The trough (24) is closed so that no dust can escape. <IMAGE>
