Abstract (en)

[origin: EP0295450A2] The invention relates to a process-controlled data input and data output device, in particular for detecting the position and/or the position change of the printing material relative to the angular position of a cylinder of a rotation printer, which device assigns information originating from a signal transmitter to the input and/or output data and has at least one memory. For a reliable and accurate detection of data changes it is proposed with a simple design that the signal transmitter information (SG) serves as the address information (AR) for the memory (7, 8) which is written on or read out in such a way that the data (DRI, DRO) is stored or output in accordance with the address information (AR).
