Abstract (en)

[origin: EP0295537A2] Anchors (1) engaging into the vertical joints (2) between adjacent stone facade-plates (3) serve to carry the stone facade-plates (3) at a distance in front of a building wall (4). The lateral adjustment for adaptation to the width of the stone facade-plates (3) is effected by the fact that the anchors (1) embedded in the building wall (4) are laterally offset in their central region. An adjusting device provided with bending equipment is used for this purpose. The anchors (1) can consist of a plurality of contiguous metal sheets (5). <IMAGE>
