Abstract (en)

This device comprises a handle (3) capable of tilting a lever (4) for actuating a lock and articulated on an outwardly open housing (1) capable of receiving the handle (3), the latter being articulated laterally, on the one hand, about two axles (16, 17) fastened to the housing (1) and, on the other hand, about two movable axles (14, 15) fixed to said handle, all these axles being within the housing (1), each axle (16, 17) fastened to the housing being connected by means of a link (9, 11; 12, 13) to a movable axle (14, 15), and these axles (14-17) being positioned in such a way that straight lines (D1, D2) each passing through a fixed axle (16, 17) and a movable axle (14, 15) connected by means of the same link intersect on the outside of the housing. This articulated mechanism makes it possible to mount the housing (1)/handle (3) assembly on the door by means of a simple sequence of horizontal translational movements which can also be executed by a robot, the latter being of very simple design. <IMAGE>
