Abstract (en)

[origin: EP0296103A2] The plastic closure has a bottom part (1) which is placed on a container neck (H) of a container (B). Held in the bottom part (1) is a pouring spout (3) which serves as a sealing peg, can be moved back and forth in the axial direction and is closed at the top. A covering cap (2) is placed rotatably on the bottom part (1). The covering cap (2) has a central opening, in which the pouring spout (3), serving as sealing peg, engages in a sealing manner in the closed position. The pouring spout (3) is provided with an external thread which meshes with an internal thread below the central opening in the covering cap. <??>The advantage of the closure consists in the good tightness and in the possibility of using a closure of this type with corresponding piercing means even on membrane-sealed or foil-sealed containers. <IMAGE>
