Abstract (en)

[origin: EP0296382A2] Known are self-erecting mines in which erecting elements (12) which can be swung out are attached in an articulated manner to the lower end of the mine body (10). When the mine body (10) has assumed any position on the ground, the erecting elements (12) are swung out in order to erect the mine body. <??>The object on which the invention is based is to protect the erected mine body against tipping over as a result of laterally acting forces F. <??>According to the invention, the erecting elements (12) can be locked in the swung-out state, so that they cannot swing back. The effective standing area of the mine body (10) is thereby increased. <IMAGE>
