Abstract (en)

[origin: EP0297029A1] 1. Method of regulating the steam supply in a steaming chamber (1) for continuous treatment of textile materials (2), by which the actual conditions within the steaming chamber (1) are measured and continually compared with a nominal value through a regulator controlled means, whereby the regulator controlled means is activated by changes in temperature, characterised in that the temperature of the steam atmosphere is measured at a point of measurement (f) outside the steaming chamber (1), within a pipe (3) which is able to communicate freely with the steam atmosphere inside the steaming chamber and with the outside atmosphere, whereby the point of measurement is connected to the region of the lowest steam layer existing within the steaming chamber (1).
