Abstract (en)
[origin: EP0297509A1] In a coping for walls (2), consisting essentially of bent or extruded flat profile sections (18-20) and angled holders (8) for these profile sections, which can be attached with mutual spacings to the masonry, the profile sections consist, in turn, of separate first (18) and second (20) parts, the former to be attached substantially horizontally and the latter substantially vertically, which engage in one another via interfitting bent portions (22, 24), whereas the holders (8) have two legs (10, 12) which substantially follow the profile of the profile sections and engage in bent portions (14, 16) at the outer edges of the two types of profile-section parts (18, 20). By separating the two profile-section parts, it is possible to mount them in a manner simple per se and in doing so to arrange them offset, thereby substantially preventing dirty water blown sideways by the wind from reaching the side of the vertical profile-section parts. <IMAGE>
