Abstract (en)

The invention relates to a plastic drainage pipe with laterally corrugated wall (1). The material forming the wall (1) of the pipe is in at least one zone along the length of the pipe arranged to overlap so that the overlapping parts (9, 10) of the pipe form between them water inlet channels (8, 16), the entry apertures of which channels are orientated downwards with the pipe in its installed position. The invention additionally relates to a method for manufacture of such drainage pipe by placing the free parts (9, 10) of the pipe one on top of the other and joining them permanently together for example by glueing or welding.
