Abstract (en)
[origin: EP0298328A1] In a facade wall having a load-bearing skeleton of posts (10) and bars (14, 16) and having wall fillings (26), such as glass panes, wall panels, frame elements or the like, which are inserted in sealing profiles (18, 24) and held on the load-bearing skeleton by means of outer pressing strips (20, 22) with the interposition of the sealing profiles (18, 24), the bars (14, 16) are designed as light-metal profiles which are positively held on the posts (10) via fastening elements (100). The horizontal bars (14) extend continuously over a plurality of posts (10). The bars (14, 16) are held on the fastening elements (100) by the fact that, in the longitudinal direction of the bars (14), displaceable sliding parts (38) are slid over the fastening elements (100) in such a way that they engage positively behind the fastening elements (100). <IMAGE>
