Abstract (en)

The object of the present invention is an apparatus to increase the storage capacity of rooms, in particular of motor car garages, composed of a lift device, supported by a framework (1), formed by a frame (50) supporting two plates (51, 53), a front one (51) and a rear one (53), having such a size that they hold the front wheels and the rear wheels of a vehicle, in which the rear plate (53) is provided with inclined oscillating planes (54) which position themselves by gravity, thus facilitating the entrance of the vehicle, when the frame (50) rests on the ground, while they are lifted when the frame (50) is hanging, thus leaving free space for the lower vehicle, said frame (50) having side beams (57) partially offset in a vertical plane, in order to facilitate or allow the access to the vehicle placed below, even with a limited lifting of the frame (50).
