Abstract (en)
[origin: WO8805006A1] A pressurisation packaging system comprising a vessel (1) for holding cargo therein, at least one resilient flexible membrane (3) disposed between an inner wall (4) or walls of said vessel (1) and goods (7) or cargo located within the vessel thereby enveloping the cargo. The system has means for applying positive and/or negative pressure to a space so formed between the inner wall (4) and the membrane (3) so that when a positive pressure is applied to the said space the membrane or membranes are urged against the said goods or cargo such that the membrane or membranes conform to the peripheral shape of the cargo thereby enveloping and containing said cargo, and when a negative pressure is applied to the space between the membrane and the said inner wall the said membrane or membranes are urged away from the cargo in the direction of the vessel wall thereby releasing said cargo.
