Abstract (en)  
[origin: EP0300171A1] Grippers (14) are fixed to elements (62) of a rotationally driven conveying chain (58). The leading edge (13') of each product (12) of an overlapping stream (S), in which each product (12) lies on the following product, is brought into contact with a clamping jaw (78) of a gripper (14) and is seized from above by a clamping finger (90). The conveying direction (B) of the transporting device (10) and of the feed conveyor (11) is rectified in the transfer region (A). During the closing movement along the path of movement (136), the clamping finger (90) lifts the region of the preceding product (12) which covers the leading edge (13') of the product (12) to be seized. <IMAGE>
