Abstract (en)
[origin: EP0302985A2] A holder (10) for a contact carbon brush is proposed, particularly for an electric motor, which has a rectangular housing (14). A longitudinal slot (30) originates from the front end face (32) of the housing (14), within which slot (30) a braided element originating from the rear end of the contact carbon brush (12) moves freely. The braided element is connected to the housing (14) via an open sleeve (68) facing the longitudinal slot (30), which sleeve (68), for its part, originates in the region of the front end face (32) of the housing (14). A spring element is inserted from the rear face (48) of the housing (14), whose mobility is limited firstly in the front region of the housing (14) by a change in cross-section and, in the rear region, by web-shaped sections (50, 52, 56, 58), which can be bent towards one another. <IMAGE>
