Abstract (en)  
[origin: EP0303956A2] In a meat-mincing machine with motor and gearing, rotary switch for switching on and off the motor, receptacle case, conveying housing, conveying worm and locking device for the exactly positioned fixing of the conveying housing in the receptacle case, the locking device comprises a locking shaft on which a first blocking segment is arranged fixed in terms of rotation. A second blocking segment is connected fixed in terms of rotation to the rotary switch. The first blocking segment is designed in such a way and can be moved into the path of movement of the second blocking segment in such a way that the rotary switch can only be rotated into the switch-on position if the locking device is in the engaged position and as a result the conveying housing is fixed with exact positioning in the receptacle case. <IMAGE>
