Abstract (en)
[origin: EP0303992A1] 1. Rack bar, particularly for electroplating conductor plates or the like, with a device for clamping the rack bar on a support rail which is divided into at least two support rails running essentially horizontally arranged at a distance from one another, characterised in that the clamping unit has a tensioning device comprising two wedge pieces (4, 6) of which the one (4) is fixed to the rack bar (1) and the other (6) is arranged so movably that the respectively oblique surfaces of the wedge pieces (4, 6) are slidable on one another and that the wedge piece (4) fixed to the rack bar (1) runs at its straight surface parallel to the lower support rail (3) and the straight surface of the movable wedge piece (6) parallel to the upper support bar (2) so that the rack bar (1) can be connected with the carrier rail by clamping action by means of the wedge pieces (4, 6) arranged between both support rails (2, 3).
