Abstract (en)
[origin: WO8806420A1] An improved bracket arrangement for a slotted wall system is disclosed. The arrangement provides for vertically positioning the bracket (30, 66) regardless of the angle of the slots (23) along the wall. A rotatable positioning bar (38, 59, 60) is attached to the back of the bracket which allows the bar (38, 59, 60) to be positioned transverse to the longitudinal axis of the slot (23) while the bracket (30, 66) is maintained in a vertical orientation. Cam means (50) are used to wedge the bar (38, 59, 60) of the bracket and the back of the bracket between the slot (23) and the face of the wall (20).
