Abstract (en)
[origin: EP0305652A1] In a noise protection device for a vessel cleaning machine, in which feed opening and discharge opening are arranged one above the other on one front side of the vessel cleaning machine (2), the supply of the conveyed product to the feed region (4) and the removal of the conveyed product from the discharge region (6) are effected substantially on separate conveying devices (8, 10) extending parallel to the front side of the vessel cleaning machine, and the upper of the two conveying devices is set back relative to the lower of the two conveying devices in the direction of the front side of the vessel cleaning machine, at least two noise protection walls (32, 34), extending parallel to the front side in mutually offset planes, are held, independently of one another and so as to be displaceable substantially in the vertical direction, on a supporting frame (12) arranged on the front side of the vessel cleaning machine (2), a lower noise protection wall (32) covering, in its closed position in the vertical direction, at least the lower feed or discharge region (4) situated between lower conveying device (8) and upper conveying device (10), and an upper noise protection wall (34) covering, in its closed position in the vertical direction, at least the upper discharge or feed region (6). <IMAGE>
