Abstract (en)

[origin: US4925535A] The process for production of an aromatic concentrate for use as a blending component for gasification fuel includes subjecting another feed hydrocarbon mixture to an extractive distillation using N-substituted morpholines as selective solvent in a extractive distillation column. Low-boiling non-aromatics with a boiling range up to about 105 DEG C. practically completely and higher-boiling non-aromatics with a boiling range between about 105 DEG and 160 DEG C. to a substantial extent are discharged as a raffinate from the top of the extractive distillation column. The extract bottoms from the extractive distillation are fed to a solvent stripping column where the solvent is at least partially recovered from other hydrocarbons. To eliminate condensation and polymerization products due to components with a boiling point over 170 DEG C. from the feed hydrocarbon mixture which can impair the process, a feed hydrocarbon mixture which contains those high boiling components is predistilled prior to extractive distillation to remove them. The top product from the predistillation column is fed to the extractive distillation column for extractive distillation. The predistillation residue can then be added to other hydrocarbons to form the aromatic concentrate.

Abstract (de)

Die Erfindung betrifft eine Ausgestaltung des in der DE-OS 36 12 384 beschriebenen Verfahrens zur Herstellung eines zur Verwendung als Blendingskomponente für Vergaserkraftstoffe geeigneten Aromatenkonzentrates. Hierbei wird das Einsatzkohlenwasserstoffgemisch einer Vordestillation unterworfen, bei der bis 169°C siedende Bestandteile destillativ abgetrennt und der Extraktivdestillation zugeführt werden, in der die weitere Aufarbeitung gemäß dem Verfahren nach der DE-OS 36 12 384 erfolgt. Der Destillationsrückstand der Vordestillation wird dagegen dem als Blendingskomponente dienenden Aromatenkonzentrat zugesetzt.
