Abstract (en)

[origin: EP0305957A2] For propping gate, door, window or suchlike wings in their closed state, there is a vertically adjustable supporting-bolt device 1 preferably designed as a retrofittable unit and essentially consisting of a vertical rod 2 with lower supporting bolt 3, an upper manual actuation lever 4 and a retention body 5 arranged between them, whilst upper and lower guide tabs 7 and 8 are arranged on a wing profile tube 6 for the purpose of the rotatable mounting of the rod 2. The retention body 5 serves, in conjunction with at least one retention element 11 arranged on the wing profile tube 6, for the vertically upwardly directed support and retention of the supporting-bolt device 1, a bottom plate 15 with a recess for fixing the supporting bolt 3 being provided underneath the wing profile tube 6. For fixing gate, door or suchlike wings in their open state, there is a lateral fixing device 21, in which a unit 25 consisting of a slide-on wedge 23 and of a catch hook 24 is arranged vertically adjustably over the height of a vertical carrier 22. The vertical carrier 22 is formed by two U-sections 26 and 27, between which the displaceable unit 25 is fastened by clamping, the slide-on wedge 23 and catch hook 24 projecting at right angles between the U-leg ends 28 and 29 of the U-sections 26 and 27. <IMAGE>
