Abstract (en)

[origin: EP0306878A2] A container having at least one bung can be virtually completely emptied and, even in the case of an at least partially embossed lid, an axially parallel position of the bung or bungs results if the latter are mounted inside surface regions of the lid which are pressed out of its plane in planes extending perpendicular to the axis of the container, the region for the bung of greater diameter being pressed upwards out of the basic plane of the lid and that for the bung of smaller diameter being pressed out downwards. Further improvements are achieved by a circumferential, radially inclined annular zone and a circumferential bead adjoining said annular zone. <IMAGE>
