Abstract (en)

[origin: EP0306913A1] The invention relates to a tap-off connector enabling branch-off equipment to be connected to a coaxial cable. The connector comprises two separable complementary parts (2, 3) in order to permit the positioning of the coaxial cable (1) crosswise in an immobilising conduit provided between them. One of the parts (2), forming a base, carries, on its bearing face (2A) on a support (5), connecting pieces permitting direct branch-off of connection points of the connector to the coaxial cable with the support. The connection point or probe (17), intended to be connected to the core, is detachably mounted in a positioning guide (20) of the base which is oriented so as to permit the insertion and the removal of the probe, even when the connector is firmly attached to the support by its base. <IMAGE>
