Abstract (en)
[origin: EP0307333A1] A roller blind (1) for a door, a window or the like comprises an apron part which is rolled up and unrolled from a drum (2) controlled in rotation by a drive device (36), such as a winch or the like, and mounted in free rotation on a shaft divided into two sections (4, 5), one extending the other, one (4) of these shaft sections being provided with a return spring (9) facilitating rolling-up of the said apron part. In order to facilitate centring of the said roller blind (1) relative to the door or window, means (10, 101) are provided for axial adjustment of the drum (2) relative to each of the shaft sections (4, 5) in order to vary the length of the projecting part (11, 12) of the latter at the ends (6, 7) of this drum (2). <IMAGE>
