Abstract (en)

[origin: WO8706615A1] A method for the fermentation of pre-treated and liquefied starch to ethanol where the starch material is saccharified to glucose by the enzyme amyloglucosidase, and the glucose is fermented to ethanol by the micro-organism *Zymomonas mobilis* in a single fermentation vessel. The ratio of amyloglucosidase cells to *Zymomonas mobilis* cells can be varied so that saccharification and fermentation steps occur at the same rate. The starch concentration is in the range 10 % to 30 % (w/v).
