Abstract (en)
[origin: JPH0197301A] PURPOSE: To prevent a dazzling action at the edge and the stepped part of a reflector segment, by constituting the reflector with a plurality of segments each having a different geometric shape so that the transition parts of geometric shape of the segments have a common tangent. CONSTITUTION: A focal chain of two upper segments 6, 9 is near a reflector top part, within a range behind a coil, and a focal chain of two lower segments 12, 15 is on an incandescent coil 18 end part farther from a top part thereof. The downward displacement of a coil image generated when a focal distance moves continuously from the rear end to the front end, and vice versa, is achieved by appropriate reflector geometry. Therefore, arranging all the coil images below a light and shade boundary line can be also achieved. The different geometry of the segments continuously forms a total reflecting mirror without any steps between the segments. The transition parts of geometric shapes of the segments are constituted to have a common tangent, so that manufacture is facilitated, and a dazzling action is not generated at the edges or stepped parts of the segments.
