Abstract (en)
[origin: JPH01156577A] PURPOSE: To obtain a treatment preparation well dispersible in cold water and capable of improving the feeling of a textile product by reacting a specific monocarboxylic acid, etc., with a hydroxyalkylpolyamine in the presence of a specific dispersion accelerator and then neutralizing unreacted amino groups. CONSTITUTION: An aliphatic 8-22C monocarboxylic acid or its amide-forming derivative is reacted with a hydroxyalkylpolyamine (e.g. dihydroxyethylenetriamine) in the presence of a dispersion accelerator selected from among aldose or ketose type monosaccharides and their polyhydroxy derivatives derived therefrom by hydrogenating thereof, a polyol, e.g. pentaerythritol, an alkyl glycoside, a sorbitan ester and a natural or a synthetic hydrophilic polymer (e.g. gelatin), etc., and unreacted amino groups are then neutralized with a lower carboxylic acid (e.g. glycolic acid) to afford a treatment preparation for textile products containing the dispersion accelerator in an amount of 0.5-10 wt.% (based on the accelerator and the condensate) in the fatty acid condensate. The treatment preparation is capable of improving the feeling such as flexibility by use thereof in an agent for fiber finishing, a detergent, etc.
