Abstract (en)

The closure comprises a plurality of elements (10) which are mounted between two upper (7) and lower (8) supporting members and which are capable of being deformed from an initial closing position by the gases generated during the ignition of the missile (2), characterised in that each element (10) of the closure is elastic and is deformed about at least one rounded part (19) formed on said lower member (8). The invention is used particularly for missile containers on board warships. <IMAGE>

Abstract (fr)

L'Opercule comporte plusieurs éléments (10) qui sont montés entre deux organes supports supérieurs (7) et inférieurs (8), et qui sont susceptibles de se déformer d'une position initiale de fermeture par les gaz produits lors de la mise à feu du missile (2), caractérisé en ce que chaque élément (10) de l'opercule est élastique et se déforme autour d'au moins une partie arrondie (19) ménagée sur ledit organe inférieur (8). Application notamment aux conteneurs de missiles embarqués sur des bâtiments de guerre.
